

Stress-test your campaign against your buying committee, *before you spend.*

Marketing is the only discipline that tests in production. WhyUser runs your ads, pages, emails and content past a simulated buying committee first, then tells you which buyer disengaged, where, and why.

What it is

A staging environment for campaign spend. Your draft assets, read cold by the committee that decides the deal.

What it does

Flags where each role breaks down, whose doubt triggers whose veto, and the ranked fix for each one.

What it is not

Not a prediction engine. A diagnostic. Hypotheses you confirm against your own analytics.

01 · who actually clicks your ad

Your reviewers are ideal buyers. *Your buyers are not.*

Who approved the page

Knows the product. Wants it to work. Reads every word.

Who clicked the ad

Never heard of you. Five seconds, nine tabs open.

3%

of cold LinkedIn traffic is in-market

100%

of your review meeting was

95:5 rule, Ehrenberg-Bass. Cold LinkedIn: 82% distracted, 15% skeptical, 3% in-market.

02 · why the data comes too late

Engineering has staging. Ops has dry runs. *Marketing opens on opening night.*

No rehearsal. No preview audience. You buy the traffic in order to find out whether the message works. The data comes back saying 74% bounced, and never once which sentence lost the CFO.

87%

leave before they ever enter the CRM

\$0

of that spend is recoverable after the fact

03 · your pre-launch dry run

Rehearse the launch. *Then buy the traffic.*

Your buying committee

economic buyer · technical lead · champion · security reviewer · end user

×

Three behavioural states

distracted · skeptical · in-market, weighted to your channel

×

Many independent passes each

every role, in every state, reading your asset cold

Not *tighten the copy*. Rather: the champion cannot find the ROI proof, so the CFO stalls.

04 · how the buyers are built

Not AI characters. *Not last year's persona deck.*

Vendor profile

what you actually sell and charge

Community voice

how buyers talk when no vendor listens

Competitor voice

what their customers complain about

Sales call transcripts

objections that killed real deals

Institutional knowledge

what your team never wrote down

Compiled and frozen before the page opens, so two runs stay comparable.

05 · why the output is checkable

A chatbot gives you an opinion. *This gives you a result.*

Reproducible

fix one line, re-run, and the only thing that changed is your line

Counted

a pattern in 8 of 10 runs is a finding; 2 of 10 is noise

Gradable

every call marked hit or miss against what actually happened

Anchored

every finding names the role, the element and the line

Run it on a campaign whose outcome you already know, and grade us yourself.

06 · what you can forward

Four artifacts. *Every one of them forwardable.*

The verdict

ship, fix or do not launch, and who decides

The conflict graph

which buyer blocks which, and where it stalls

The ranked fix list

element-level, with the role it unblocks

The battlecard

the objections each role raises, before the call

You own the number. The web team owns the page.

Opinion versus opinion loses to whoever is loudest. An outside finding you did not author ends that argument.

07 · we already use an AI assistant

You already have a creator. *You are missing a validator.*

	ask an assistant	run the simulation
who reads it	One reader, invented at answer time.	Five buyers compiled from evidence, frozen up front.
what comes back	One opinion. Ask again, get another.	A rate across many passes. Marked hit or miss.
what it remembers	Nothing. Every session starts at zero.	Your buyers. Run ten is sharper than run one.

Same personas. A script versus a system. The veto is computed, not written.

08 · the budget math

2% of the spend, *to de-risk the other 98%.*

your paid spend

\$50,000 a month, for example

bouncing at 72%

~\$12,600 a month of it diagnosable

what WhyUser costs

about 2% of the spend it protects

The \$12,600 is your waste, not our fee. Program budget, not tools budget. No procurement.

Fail in the test. Win in the market.
